 ← Maccabi Rehovot (1 game)

Data cross-referenced with the official Basketball Association box score (5 out of 10 games)

### Analysis Summary

In his weakest quarter of games he contributed an average of only 1.5 - with almost no measurable contribution - compared to an average of 11.2 in the window and 26.5 on his best nights. This means the average relies on some games, not all of them. His minutes ranged from 6 to 34 · part of the variance is rotation and not the player.

A 10-game window was chosen because below that the average is too noisy (standard error of 3.2 points in 5 games vs. 2.2 in 10), and above it mixes different periods and roles.

## Maintain

- **Game management and court vision:** The assist metric stands at 3.9 per game at the 80th league percentile, including a peak of 10 assists against Nahariya. This consistency in the core role indicates high passing ability even under rotation changes and team transitions.
- **Personal defensive discipline:** The foul average in the window stands at only 1.7 (61st percentile), with no games having 2 fouls or more in the first 6 minutes of the 1st quarter (0 out of 9). This discipline allows maintaining a spot in the rotation without getting into early trouble.

## Improve

- **Output and playing time stability:** The performance floor stands at only 1.5 PIR on weak nights compared to an average of 11.2, while playing time ranges extremely from 6 to 34 minutes throughout the window. The cost is reflected in a drop in offensive production (5.7 points and 0.7 assists in the last 3 games) due to a lack of confidence in the rotation status.
- **Outside shooting volume and efficiency:** Three-point shooting stands at only 28% (5/18) in the window, a figure that eroded to 25% (1/4) in the last 3 games. The cost is damage to spacing and the ability to punish as a point guard against defenses that drop into the paint.

- **Free throw conversion:** Overall free throw percentage in the window stands at only 50% (10/20), including critical misses in clutch time. The cost is a loss of easy points that would have raised the overall efficiency rating (PIR) beyond 11.2.

### 3-Week Plan

1. **The biggest leverage:** 50% from the line (10/20) cost you about 5 easy points in the window. Action: Add 50 free throw shots in fatigue conditions at the end of every individual training session. Target: Raise free throw percentage to 70% and above (at least 14/20) in the next 3 games.
2. 28% from three (5/18) reflects low volume and does not create a real threat. Action: Increase the shooting volume from defined spots on the perimeter to at least 4 shots per game, focusing on **Catch-and-Shoot** threes only. Target: Maintain a minimum of 33% (2/6) from beyond the arc in the next sample.
3. Volatility in minutes (6 to 34) harms personal rhythm. Action: A fixed working day including quick decision-making drills in the pick-and-roll to ensure stable contribution even in short rotations. Target: Maintain a minimum floor of 5.0 PIR even in games with under 15 minutes of playing time.
